Alam M, Larsen R;

WPI; 2001-374832/39. N-PSDB; AAD08991 Novel isolated bacterial heme binding protein, HemAT-Hs or HemAT-Bs which reversibly binds oxygen with low affinity, useful for controlled storage of oxygen and for sensing gaseous ligands such as oxygen.

Claim 6; Page 10; 94pp; English.

binding protein, HemAT-Hs or HemAT-Bs which reversibly binds oxygen with low affinity. Haem binding protein is useful for controlled storage of oxygen by allowing haem binding protein to bind and store oxygen, and triggering the release of oxygen from haem binding protein by activating the signalling domain. Haem binding protein is useful for sensing gaseous ligands such as oxygen, NO, CO, or CN. Blood substitute comprising haem binding protein is useful for treating a patient suffering from low blood levels by administering and regulating the oxygen binding of the haembinding protein by modifying the signalling domain. Haem binding protein The present invention relates to isolated archeal and bacterial haem

                                                                                                                                                                                                                                                                                                 300
                                                                                                                                                                                                                                                                                                                                                                                    420
                                                                                                                                                                                                                                                                                                                                                                                                       420
                                                                                                                                                                                                                                                                                                                                                                                                                            480
                                                                                                                                                                                                                                                                                                                                                                                                                                                 480
                                                                                                                                                9
is useful for haem-based catalysis, for artificial photosynthesis and for identifying potential signalling functions of mutated alpha-haemoglobin and myoglobin causing several diseases. The present sequence is Halobacterium salinarium Hamar-His protein which is salt tolerant. (Updated on 11-SEP-2003 to standardise OS field)

The present invention relates to isolated archeal and bacterial haem binding protein. HemAT-Bs which reversibly binds oxygen with low affinity. Haem binding protein is useful for controlled storage of oxygen by allowing haem binding protein to bind and store oxygen, and triggering the release of oxygen from haem binding protein by activating the signalling domain. Haem binding protein is useful for sensing gaseous ligands such as oxygen, NO, CO, or CN. Blood substitute comprising haem binding protein is useful for treating a patient suffering from low blood levels by administering and regulating the oxygen binding protein is useful for treating a patient suffering from low blood levels by administering and regulating the oxygen binding protein is useful for haem-based catalysis, for artificial photosynthesis and for identifying potential signalling functions of mutated alpha-haemoglobin and myoglobin causing several diseases. The present sequence is Bacillus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         416
                                                                                                                                                                        Novel isolated bacterial heme binding protein, HemAT-Hs or HemAT-Bs which reversibly binds oxygen with low affinity, useful for controlled storage of oxygen and for sensing gaseous ligands such as oxygen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         QLKETQAEYLLGLGRGEYDTBYAAQRARIGKIHDVLGLGPDVYLGAYTRYYTGLLDALAD 150

the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding attisense nucleic acid; (4) an antibody capable of specifically binding che polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of required for proliferation, or that inhibits proliferation or the biological pathway required for cellular proliferation or the biological dentifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiocit; (10) profiling a compound's activity, (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; in a culture or collection of an expression of the strains is present in a culture or collection of a strains; or (13) identifying the target of a compound that inhibits the screening K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, proliferation of an organism. The antisense nucleic acids are useful for invention relates to an isolated nucleic acid comprising any one of New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. nucleotide sequences isolated from Pyrococcus abyssi encode proteins useful in industry

Claim 7; Page 1203-1205; 1657pp; French.

The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi is

```
a hyperthermophilic archaeon, which is isolated from deep-sea hyporthermal vents. The present sequence is one such P, abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centifigrade. Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH775903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH75903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AAH775903-AA

The invention Fracture to an interest actual compilating any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated of polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits proliferation or the biological pathway required for proliferation. Fequired gene or the biological pathway in which a proliferation required gene or the biological pathway in which a proliferation or that inhibits proliferation of an organism acts; (9) manufacturing an antibicit; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed, (12) determining the extent or organism or the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the collection of an organism. The antisense nucleic acids are useful for for which each of the strains in cells or conditional drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S aureus, S. typhimurium, cellular proliferation in cells other than S aureus, S. typhimurium, and electronic formar directly from MIPO at the sequence data for this collection of the target procesured the present sequence is encoded by one of the uning in the sequen
                                                                                                                                                                      screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    203
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               445

The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrochermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade. Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143, AAB99143, AAB99143.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF66431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade. Note: This patent is in the same patent family as AAB99143, AAH75903-AAH75920 and AAG66436
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     12;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              107

the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibite proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of
                                                                                                                                                                                                       432
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                screening

the gene product or that has an activity against a biological pathway consideration, or that inhibits cellular proliferation; (8) athway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sactivity; (11) a culture comprising atrains in which the gene compound sactivity; (11) a culture comprising strains in which the gene compound sactivity; (11) a culture compound that inhibits the crown of strains; or (13) identifying the target of a compound that inhibits the crown or strains; or (13) identifying the target of a compound that inhibits the compound that inhibits the compound strains; or (13) identifying the target of a compound that inhibits the compound that inhibits the compound that inhibits the concept of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational crown proximation in cells other than S. aureus, S. typhimurium, C. M. pheumoniae or P. aeruginosa. The present sequence is encoded by one of the traget prokaryotic essential genes. Note: The sequence data for this parent did not form part of the printed specification, but was obtained continual problemat directly from WIPO at

the invention fraction to an institute actual compilating of the nucleic acid inhibits proliferation of a cell. Also included are of the nucleic acid inhibits proliferation of a cell. Also included are coff the nucleic acid inhibits proliferation is inhibited by the antisense appropriate whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated conclined acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway or the gene product or that has an activity against a biological pathway or required for proliferation, or that inhibits cellular proliferation; (8) cangound, a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, activity; (11) a culture comparising strains in which the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the concept of a compound that inhibits the constraints of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the collection of strains; or (13) identifying the target of a compound that inhibits the collection of strains; or (13) identifying the target of a compound that inhibits the collection of collection of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids are useful for collections or for collections or for collections or for collections. K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium The invention relates to an isolated nucleic acid comprising any one of in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid, (2) a host cell containing the vector; (3) an isolated prolipeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting cellular proliferation, or the that has an operon required for proliferation, or that inhibits cellular proliferation; (8) required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required gene or its gene product is compound; a activity, (11) anditure of proliferation of the cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) antibits of a compound that inhibits the compound; a activity; (11) antibits of a compound that inhibits the compound; a conting proteins or screening for homologous nucleic acids required for proliferation of an organism. The antisense nucleic acids required for proliferation of an organism. The antisense nucleic acids required for proliferation of an organism. The antisense nucleic acids required for cellular proliferation in collections of constitution of an organism. The antisense nucleic acids required for proliferation of secreting for homologous nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids for cut this cellular proliferation in cells of the present sequence is encoded by one of the target prokaryotic essential genes Note: The sequence dat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EQMQAETEETVDQLDEVNQRIGEGVERVEEAMETLQEITDAVEDAASGMQEVSTATDEQA 440

The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF66431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade. Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 104 GRGEYD-TEYAAQRARIGKIHDVL-GLGPDVYLGAYTRYYTGLLDALADDVVADRGEEAA 161
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleotide sequences isolated from Pyrococcus abyssi encode proteins useful in industry.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  75
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention is related to fluorescent apophytochrome-bilin conjugates, known as phytofluors. An apoprotein known as Cph2 from Synechocystis species is used as the apophytochrome and the bilin is preferably phycoerythrobilin. The phytofluors are useful as fluorescent markers for biological research. The phytofluors have a long wavelength shostoption maxima, a high molar absorption coefficient and the recombinant apoproteins can spontaneously assemble with a variety of bilin chromophore precursors. The present sequence is a phytochrome related protein from Synechocystis sp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AHQCSGPRDWHQNEIDLFGQLTVQVGLALERSDLLAQQKIAE--VEQRQMREKMQKRALE

                                                                                                                                                                                                                     454
                                                                                                                                                                                                                                 screening
                                                                               281
                                                                                                                                                                          401
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense
                                 221

pulpeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that thinkis cellular proliferation, (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or underexpressed, (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the
                                                                                                                                                                                                                                                                                                                             proliferation of an organism. The antisense mucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at firetive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SFAASLDEMMAALERNDDAAYLQLKNVKAGQASAAFAARLGEFSTNLDKLSSETLAAHET 185

WPI; 2003-029926/02 N-PSDB; ACA53012 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 77066; 1766pp; English.

the first manufactures given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated on the polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide, (5) producing the polypeptide, (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway can appear a gene required for cellular proliferation, (8) identifying a gene required for cellular proliferation, (9) identifying a gene required for cellular proliferation of the pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound activity, (11) a culture comprising strains in which the gene compound is activity, (11) a culture comprising strains in which the proventy in whole the compound that inhibits strains in which the proventy in whole its compound is activity.) drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for ceilular proliferation to isolate candidate molecules for rational invention relates to an isolated nucleic acid comprising any one of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 16965, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: MARC J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
                                                                                                                                                                                                                                                                                                                                                                                                  131
                                                                                                                                                                                                                                                                                                                                                                                                                                        452
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                178
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         501

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 5. Application US/09272809
Patent No. US200202239A1
GENERAL INFORMATION:
APPLICANT: Lagarias, John C.
TITLE OF INVENTION: Phytofluors as fluorescent labels
FILE REFERENCE: 2500.1180S0
CURRENT APPLICATION UNBER: US/09/272,809
CURRENT FILING DATE: 1998-03-19
NUMBER OF SEQ ID NOS: 24
SOFTWARE: Patentin Ver. 2.0
                                                                                                                                                                                                                                     166 ELVARFLPMLKLLTFDQOIAMDTYIDSYAQRLHD-----

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
